

SPECIAL NOTES TO CUSTOMER

COLOR SELECTION

- Please confirm color selection before beginning your project. Colors shown online may vary from the actual powder.
- A physical sample can be ordered before production for approval to ensure the desired color and finish. Sample tags are available upon request and may be subject to an additional lead time.
- Some powder coat colors require a multi-coat system requiring more than a single coat to achieve the desired appearance, performance, or level of protection. Depending on the powder system selected and intended application, a project may require a base coat, top coat, or a combination of these coatings. This can affect the overall cost, material requirements, and lead time of the project.
 - Single - Step: Single powder color
 - Two – step: Base coat and color selected OR color selected and topcoat
 - Three – Step: Base coat, color selected, topcoat
- Consider the intended application and exposure of the finished product. Powder coating are available in different performance formulation, High heat, Interior ONLY, interior/exterior, Super durable, with varying levels of UV and weathering resistance.
- A properly selected powder coat primer can provide an additional layer of protection beneath the topcoat, helping improve corrosion resistance, adhesion and overall coating durability
 - Primer is available as an additional option and is recommended based on the material. Environment, and intended use of the finished product. Our team can help determine whether a primer system is appropriate for your application
- A compatible powder clear coat can be applied as an additional protective layer. It can help enhance UV resistance, color retention, gloss retention, and overall protection against environmental exposure.
 - Clear coat is an optional upgrade and is not required for every application. The level of UV and weathering protection will depend on the specific powder system selected. Our team can help determine whether a clear coat is appropriate.
